M2M - Wireless Smart Vending Machines

The implementation of a Machine To Machine Vending Solution requires the seamless integration of multi-brand vending machines with different interfaces and protocols with a centralized asset monitoring and management system as well as the Vending Machine Service Providers' ERP systems. The Vending Machines Solution uses highly developed communications gateways which are integrated with particular vending machines, taking into account manufacturer specific variations in communications protocols between the gateway to the devices.

If you have any questions or need help on your Wireless Smart Vending Project, please contact us: **M2M Info**
