

M2M - Traffic Signal Control and Monitoring:

This M2M application shows an intelligent traffic monitoring system using wireless vision sensor network that captures and processes the real-time video image to obtain the traffic flow rate and vehicle speeds along different urban roadways. This system will display the traffic states on the front roadways that can guide the drivers to select the right way and avoid potential traffic congestions. Also, it will monitor the vehicle speeds and store vehicle details, for those breaking the roadway speed limits, in a database.

If you have any questions or need help on your M2M Wireless Traffic Signal Control project, please contact us: [M2M Info](#)
